Home Tour

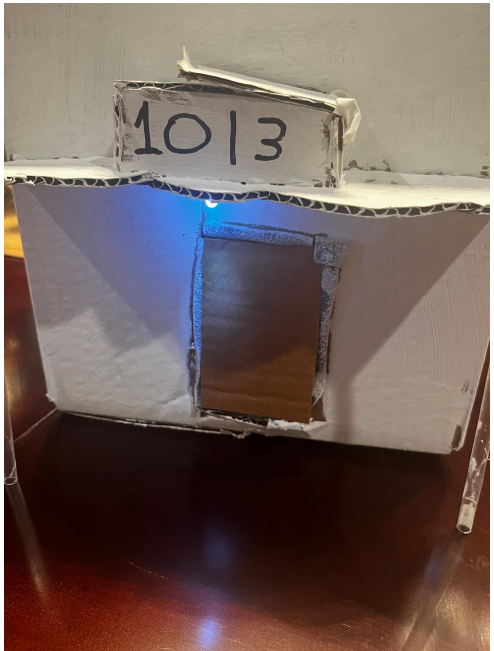

My home is well designed because it is painted like a real house and features a porch light and a realistic roof. I also wired everything in the roof so it’s all hidden and have a little battery box for the porch light.

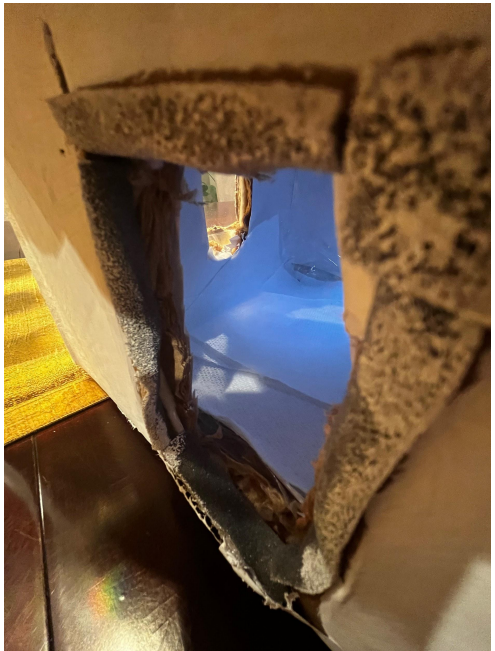

Door

I put weather strips around the door to seal the door and simply placed it on ensuring there were no gaps.

Windows

The only thing I did to insulate the windows was attach the transparent paper to it making sure to tightly tape all 4 sides of the square of the transparent paper firmly to act as the window.

Ceiling/Walls

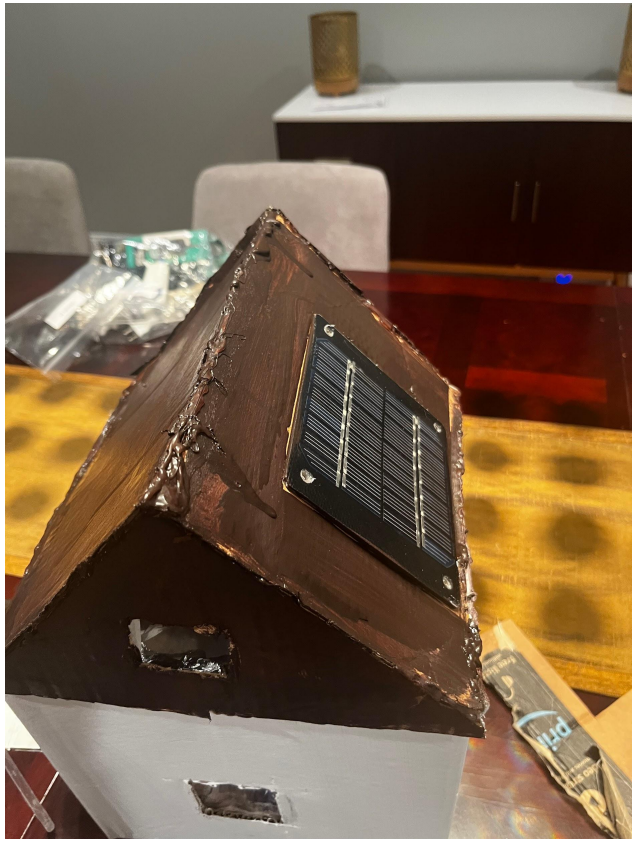

Before I insulated my Ceiling I had to wire everything from my solar panel to the two lights which was difficult and took a long time but it was worth it tried to tidy up the wires and hide them. The walls are insulated with the paper towels included as well as the like soft material and aluminum foil in the roof.

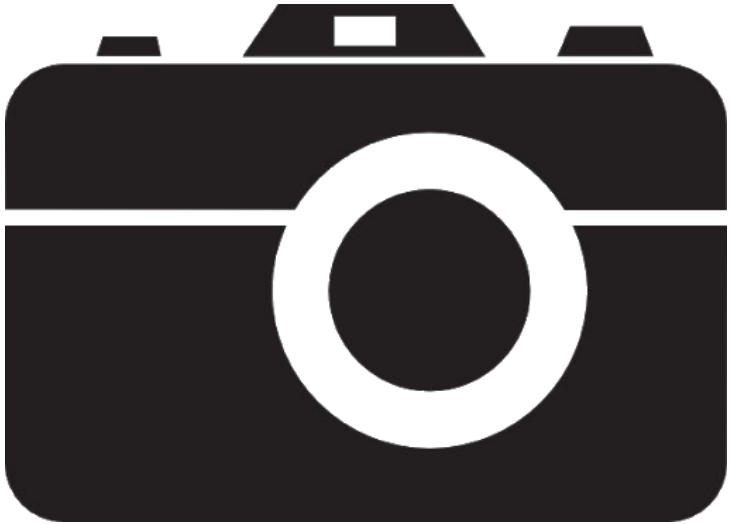

Solar Panel Siting

- I placed my solar panel there because it’s on the roof and angled a little already to face the sun when placed in a specific direction.
- I would place it in front of my house where the sun is very bright in the morning hours or in my patio if it is past noon.

Solar Panel Voltage

Wired it all before I could get the reading

Final Test

- Initial Temperature (F) = 71.4 F
- Final Temperature (F) = 70.0 F
- Temperature Change (F) = 1.4 F
